

AI Rule-Based Chatbot

Internship Project Report

Student: Pradeep Kumar

Project: AI Rule-Based Chatbot

Technology: Python 3, Visual Studio Code

Abstract

This project implements a rule-based AI chatbot using Python. The chatbot interacts with users through predefined rules created with if-elif-else statements. It accepts user input, processes it using `lower()` and `strip()`, responds to greetings and common questions, handles unknown queries, and continues running until the user exits.

Objectives

- Learn basic Artificial Intelligence concepts.
- Implement decision making using if-elif-else.
- Build an interactive command-line chatbot.
- Improve Python programming skills.

Features

Continuous conversation, multiple greetings, predefined responses, help command, graceful exit, and unknown input handling.

Algorithm

1. Display welcome message.
2. Start an infinite loop.
3. Read user input.
4. Convert input to lowercase and remove extra spaces.
5. Compare input with predefined rules.
6. Display matching response.
7. Exit when the user enters bye/exit/quit.

Conclusion

The project successfully demonstrates the fundamentals of rule-based Artificial Intelligence using Python. It serves as a strong foundation for developing advanced AI chatbots in future projects.
